The highest PHA production was obtained by extracting 4.3% of the reactor volume per cycle. Taking into account the previous simulations and the pilot plant experiments of a two-sludge configuration with EBPR and via-nitrite N-removal (Marcelino et al., 2011), a new two-sludge process including P-recovery was designed (Larriba et al., 2020).

A review on the integration of mainstream P-recovery ...

From calculus, we know the volume of an irregular solid can be determined by evaluating the following integral: Where A(x) is an equation for the cross-sectional area of the solid at any point x. We know our bounds for the integral are x=1 and x=4, as given in the problem, so now all we need is to find the expression A(x) for the area of our solid.

The permeability-surface area product (PS) of the placenta to 3[H]L-glucose was 13.8 + or - 3.9 uL min⁻¹, about 4 times higher than that expected in intact placenta. Transport of 45Ca2+ chanced rapidly when [Ca2+]m was varied. Kinetic constants of the transcellular transport of Ca2+ are the Michaelis constant– Km, = 0.45 mM and the maximum rate ...
