The features of the 'V' case are similar to that of the 'A' case. The flow pattern of mode 4 in Fig.A17(a)(b) shows that the characteristic length scale corresponds to the turbine spacing  $S_x$ . The frequency of this mode nearly equals  $f_t$ . The flow pattern alternates between positive and negative perturbations roughly on the turbine disk.

Flow batteries allow for independent scaleup of power and capacity specifications since the chemical species are stored outside the cell. The power each cell generates depends on the current density and voltage. Flow batteries have typically been operated at about  $50 \text{ mA/cm}^2$ , approximately the same as batteries without convection. [3] However ...
