Low-density lipoproteins (LDL), the products of VLDL and IDL metabolism, are the most cholesterol-rich of all lipoproteins. About 40 to 60% of all LDL are cleared by the liver in a process mediated by apo B and hepatic LDL receptors. The rest are taken up by either hepatic LDL or nonhepatic non-LDL (scavenger) receptors.

A broad classification for genetic disorders that result from an inability of the body to produce or utilize one enzyme that is required to oxidize fatty acids. The enzyme can be missing or improperly constructed, resulting in it not working. This leaves the body unable to produce energy within the liver and muscles from fatty acid sources. The body's primary source of energy is glucose ...

Modest benefit has been shown from transdermal testosterone therapy given to postmenopausal women with reduced sexual desire. An increased frequency of satisfying sexual encounters and intensity of sexual desire and response has been shown in medically and psychiatrically healthy women able to have 2-3 satisfying sexual experiences each month before therapy commences.
